

# Designing Applications that See

## Lecture 5: Motion and Tracking

Dan Maynes-Aminzade

22 January 2008

# Reminders

- Assignment #1 due now
- Assignment #2 available next Tuesday
- Bring your webcams on Thursday for the Processing Tutorial
- Sunday is the add deadline

# Today's Goals

- Learn how to detect, measure, and predict motion in a video sequence
- Get a high-level overview of some different tactics for tracking moving objects

# Outline

- Look at some of your videos from Assignment #1
- Learn about some motion and tracking techniques and try them out on your videos
  - Frame differencing
  - Background subtraction
  - Motion templates
  - Optical flow
  - Color tracking

# Tennis Balls

*Carl*

*Marcello*

*Eric*

*Yangfan*

*Michael*

# Intersection

# Farmers' Market

# Foosball

# Fish

# Around the House

# Bikes

# Clothes

# Driving

# Fish

# Kitchen

# Laundry

# Ping-Pong

# Plate

# Sandwich

# Traffic

# Types of Motion Determination

- Motion Detection: identifying whether or not image points are moving
- Motion Estimation: identifying how image points are moving
- Motion Segmentation: identifying moving objects from moving points

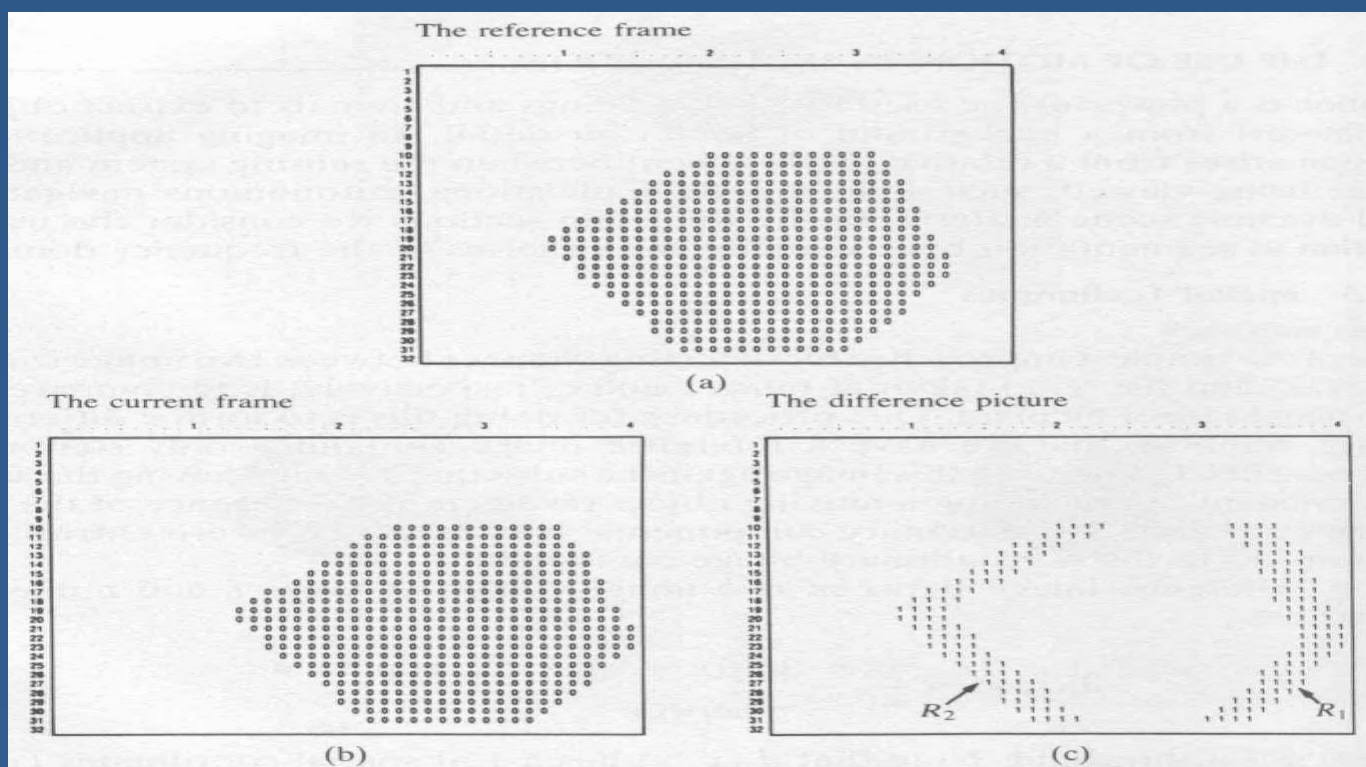

# Extracting Moving Objects

- Simple case: static background, with only the object of interest in motion

# Solution: Frame Differencing

- Subtract current frame from previous frame, and threshold the result

# Accumulative Frame Differencing

- Estimate motion direction by accumulating motion history over a range of frames

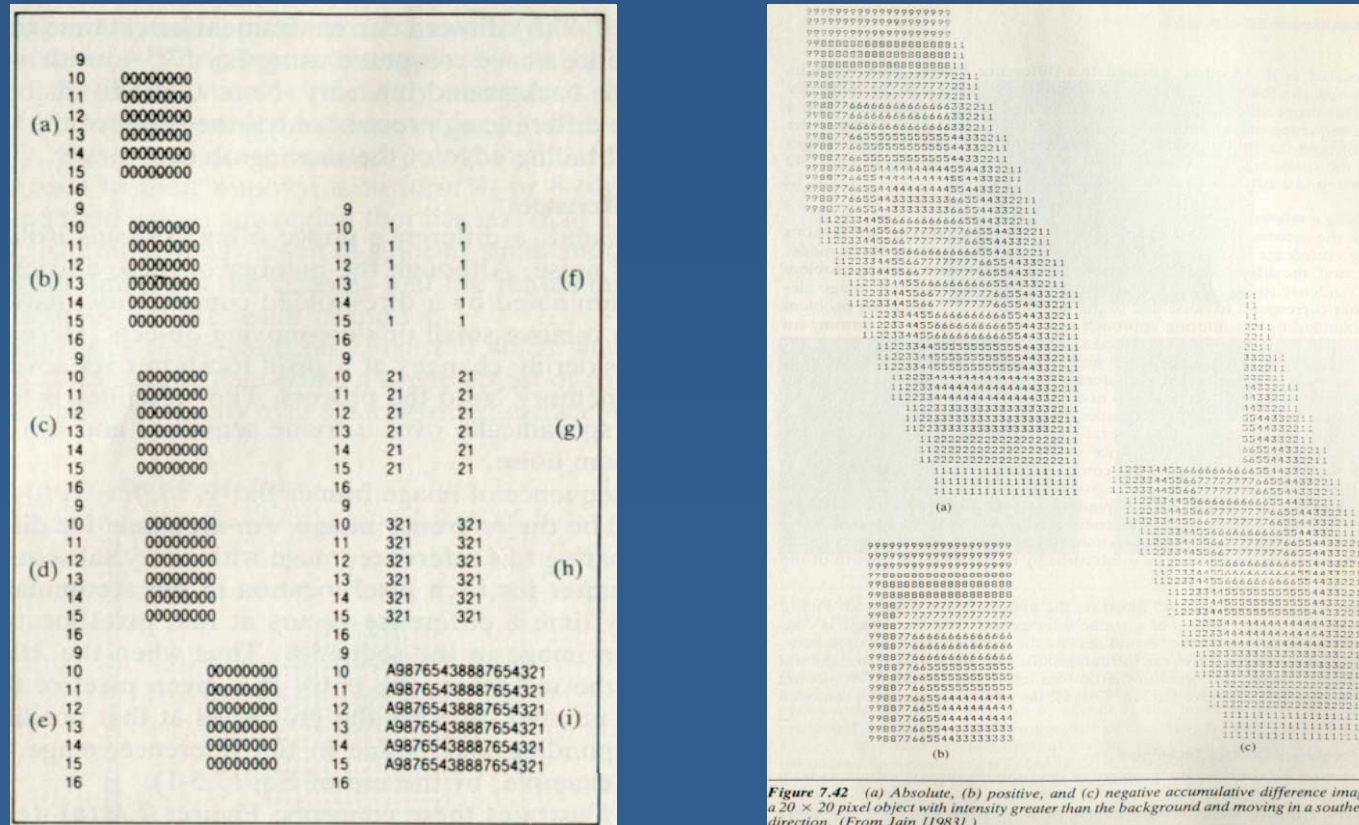

Figure 7.42 (a) Absolute, (b) positive, and (c) negative accumulative difference image of a 20 x 20 pixel object with intensity greater than the background and moving in a southeast direction. (From Jain [1983].)

# Motion History Image

a b c

**FIGURE 10.49** ADIs of a rectangular object moving in a southeasterly direction. (a) Absolute ADI. (b) Positive ADI. (c) Negative ADI.

# Multiple Moving Objects?

*(courtesy of Sebastian Thrun)*

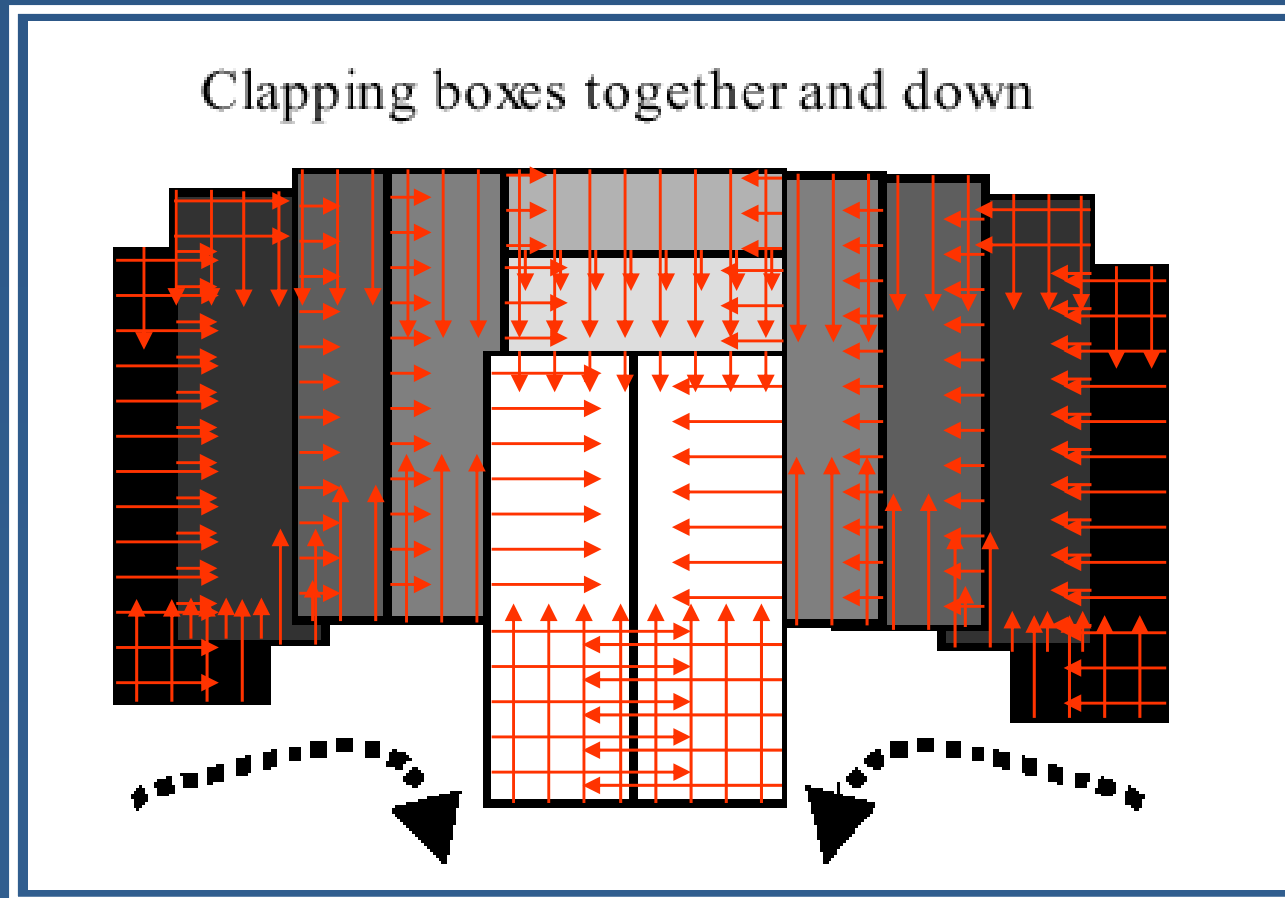

# Motion Segmentation

- Add timestamp to current motion history image, and overlay it on top of the older ones

# Motion Segmentation

- Measure the gradients of the stack of motion history images

# Motion Segmentation

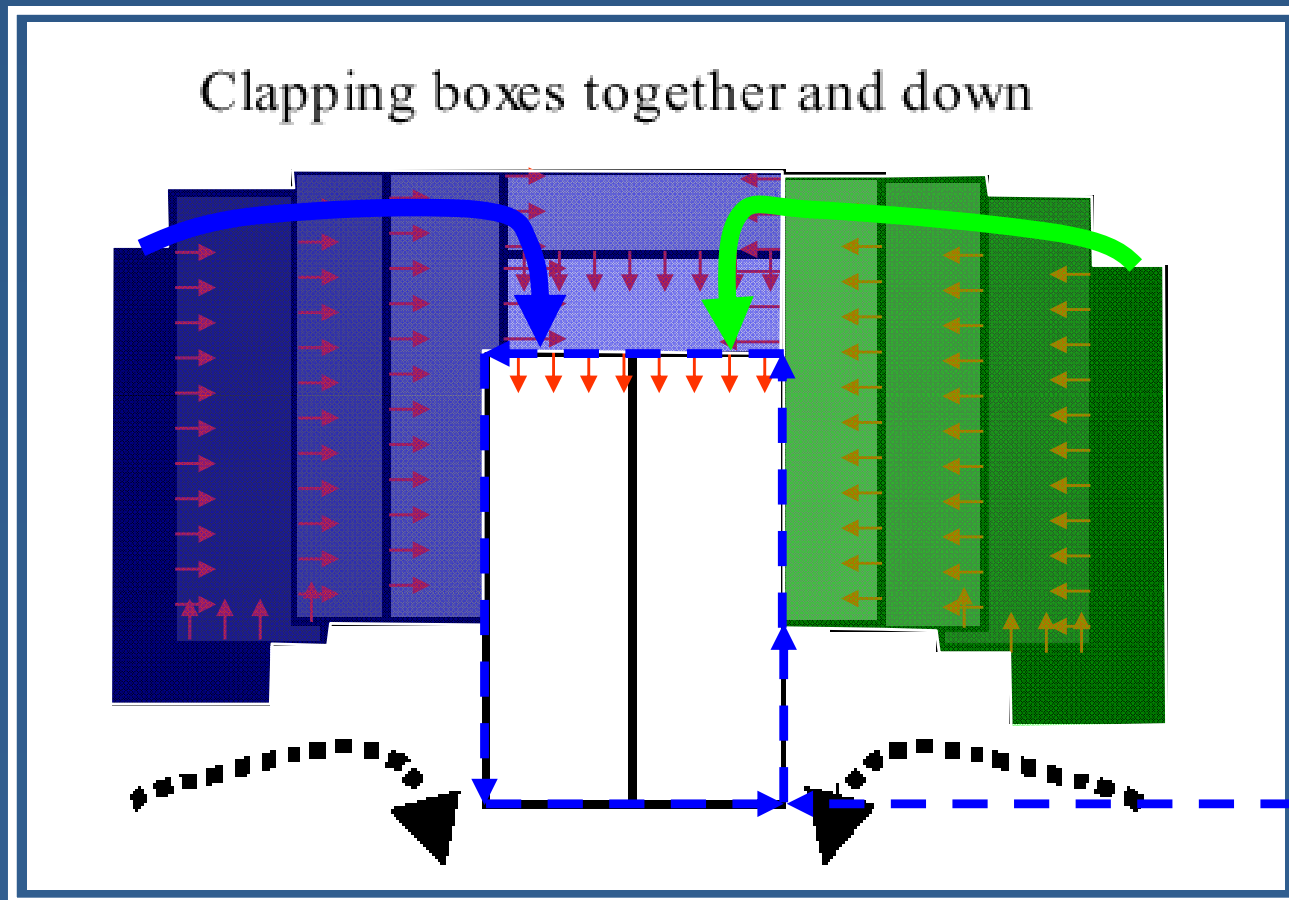

- Ignore motion template edges resulting from too large of a time delay

# Motion Segmentation

- Find boundaries of most recent motions and fill them in to segment motion regions

*Segmented Motion*

*Segmented Motion*

# Let's Try It Out!

# Background Subtraction

- If we know what the background looks like, we can ignore it to focus on things that are moving or changing

-

=

# Blue Screen

# Video Example

# Subtraction and Thresholding

low thresh

high thresh

EM (later)

# Basic Background Subtraction

- Assume background is mostly static
- Build a background model by averaging pixel values across a range of frames
- Given a new image, generate a silhouette by marking the pixels that are significantly different from the “background” value

# Finding Subparts

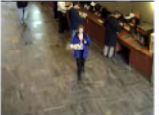

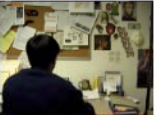

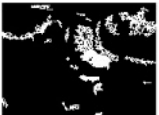

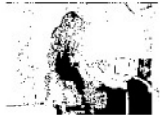

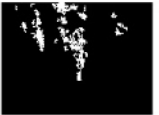

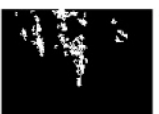

- Look at contour shape and mark points farthest from the center as hands
- Can be combined with a skin color model for better results

# Pfinder Example

# Dynamic Backgrounds?

	Moved Object	Time of Day	Light Switch	Waving Trees	Camouflage	Bootstrapping	Foreground Aperture
Test Image							
	Chair moved	Light gradually brightened	Light just switched on	Tree Waving	Foreground covers monitor pattern	No clean background training	Interior motion undetectable
Ideal Foreground							
Mean & Threshold

# Let's Try It Out!

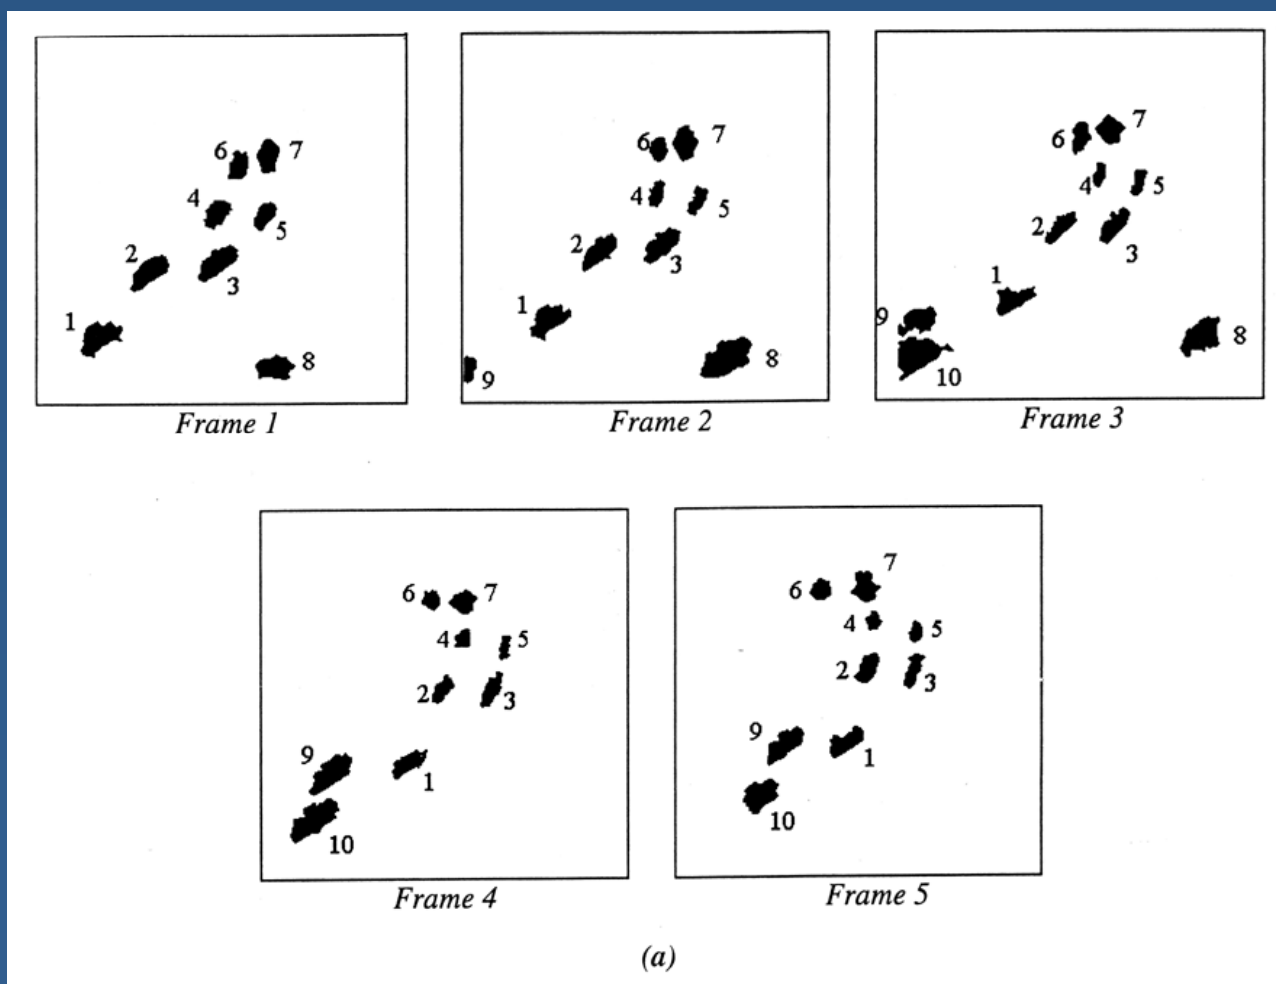

# Keeping Track of Objects

# Blob Tracking

# Let's Try it Out!

# More Complex Motion

*(courtesy of J.M. Rehg)*

# More Complex Motion

*(courtesy of J.M. Rehg)*

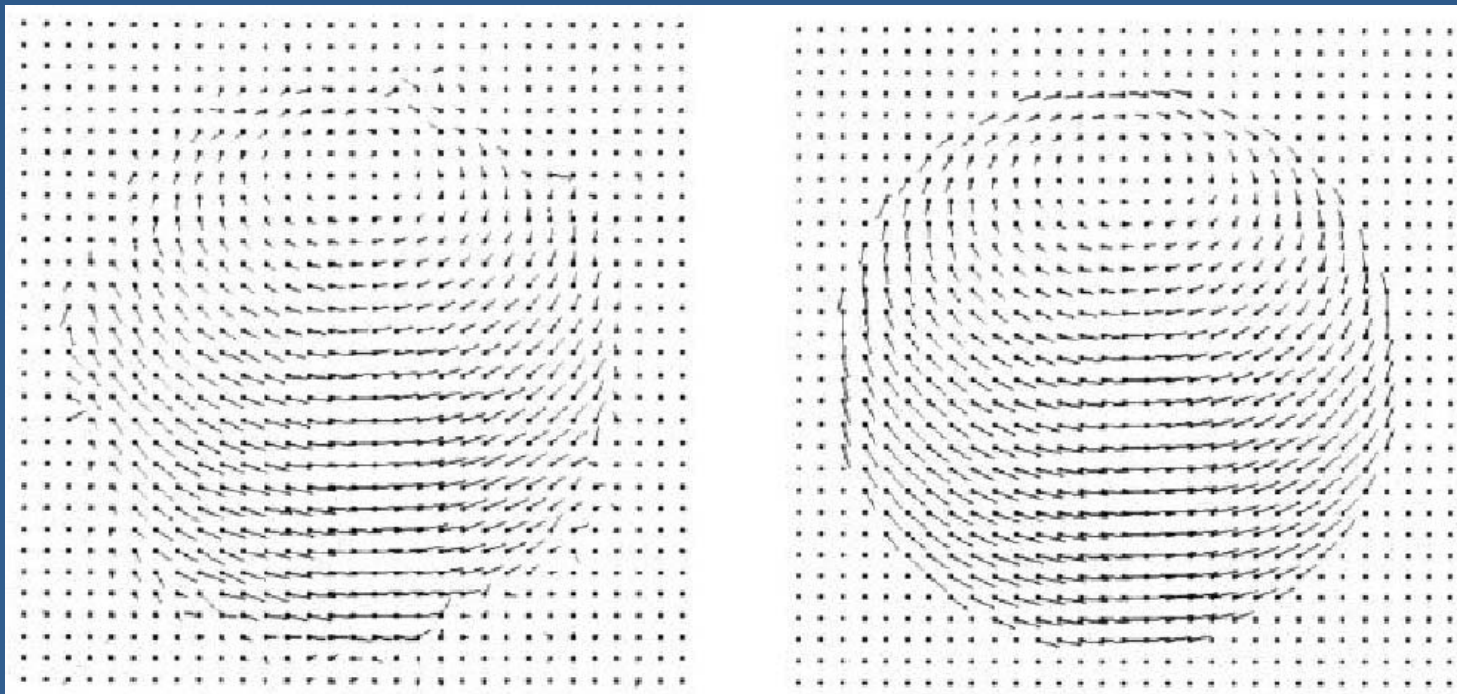

# More Complex Motion

*(courtesy of J.M. Rehg)*

# Optical Flow

- A 2-D velocity field describing the motion in an image sequence
- A vector at each pixel indicates its motion direction between neighboring frames

# Characterizing Motion

*Image Sequence*

*Flow Vectors*

*(courtesy of Sebastian Thrun)*

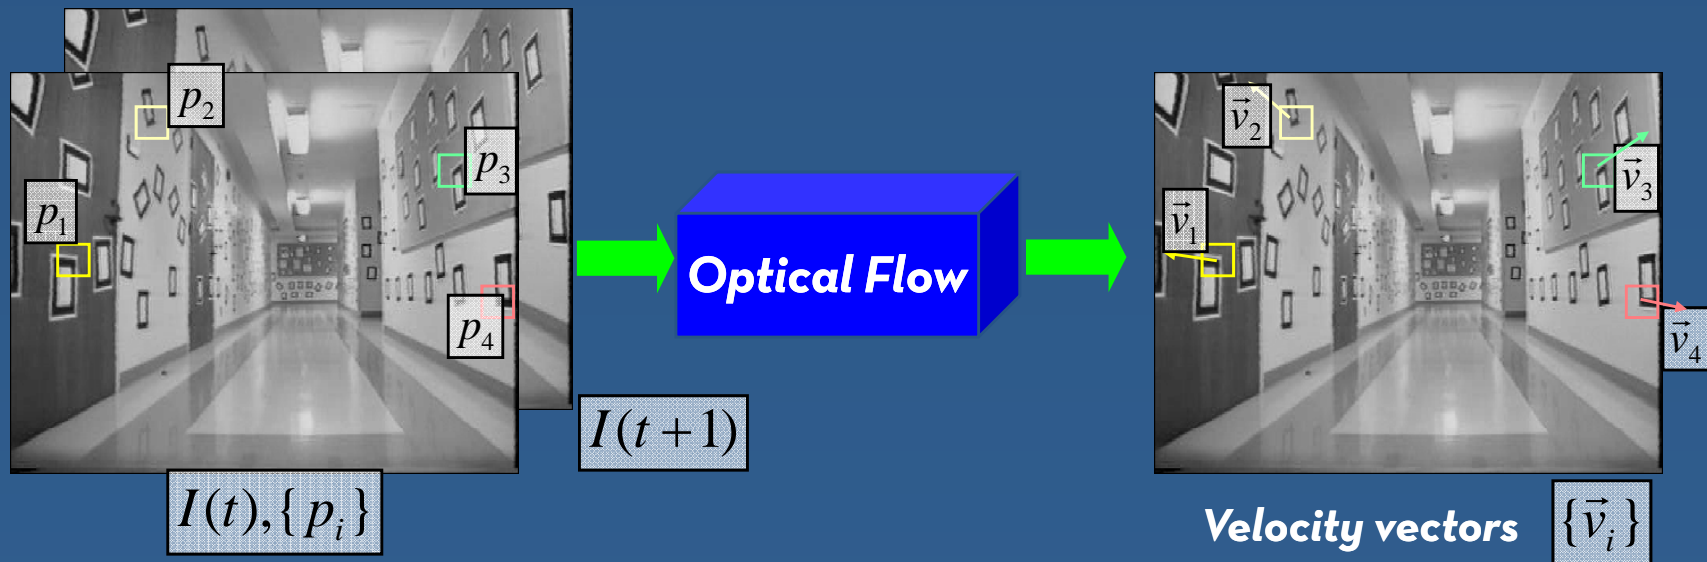

# Computing Optical Flow

*(courtesy of Michael Black)*

# Tracking Local Features

# Optical Flow Assumptions

- Brightness constancy: though regions may move around, the brightness within a small region will not change

# Optical Flow Assumptions

- Temporal persistence: gradual motion over time

# Aperture Problem

# Aperture Problem

- Motion along just an edge is ambiguous

*(courtesy of Sebastian Thrun)*

# Another Example

# Harris Corners

# Let's Try It Out!

# Segmentation by Clustering

*Image*

*Clusters on intensity*

*Clusters on color*

# Simple Clustering Algorithms

## **Algorithm 15.3:** Agglomerative clustering, or clustering by merging

```
Make each point a separate cluster
Until the clustering is satisfactory
    Merge the two clusters with the
        smallest inter-cluster distance
end
```

## **Algorithm 15.4:** Divisive clustering, or clustering by splitting

```
Construct a single cluster containing all points
Until the clustering is satisfactory
    Split the cluster that yields the two
        components with the largest inter-cluster distance
end
```

# Mean Shift Segmentation

*Original Image*

*Segmented Image*

*(courtesy of D. Comaniciu)*

# Mean Shift Algorithm

- Goal: find the points of highest density (“modes”) in the data distribution

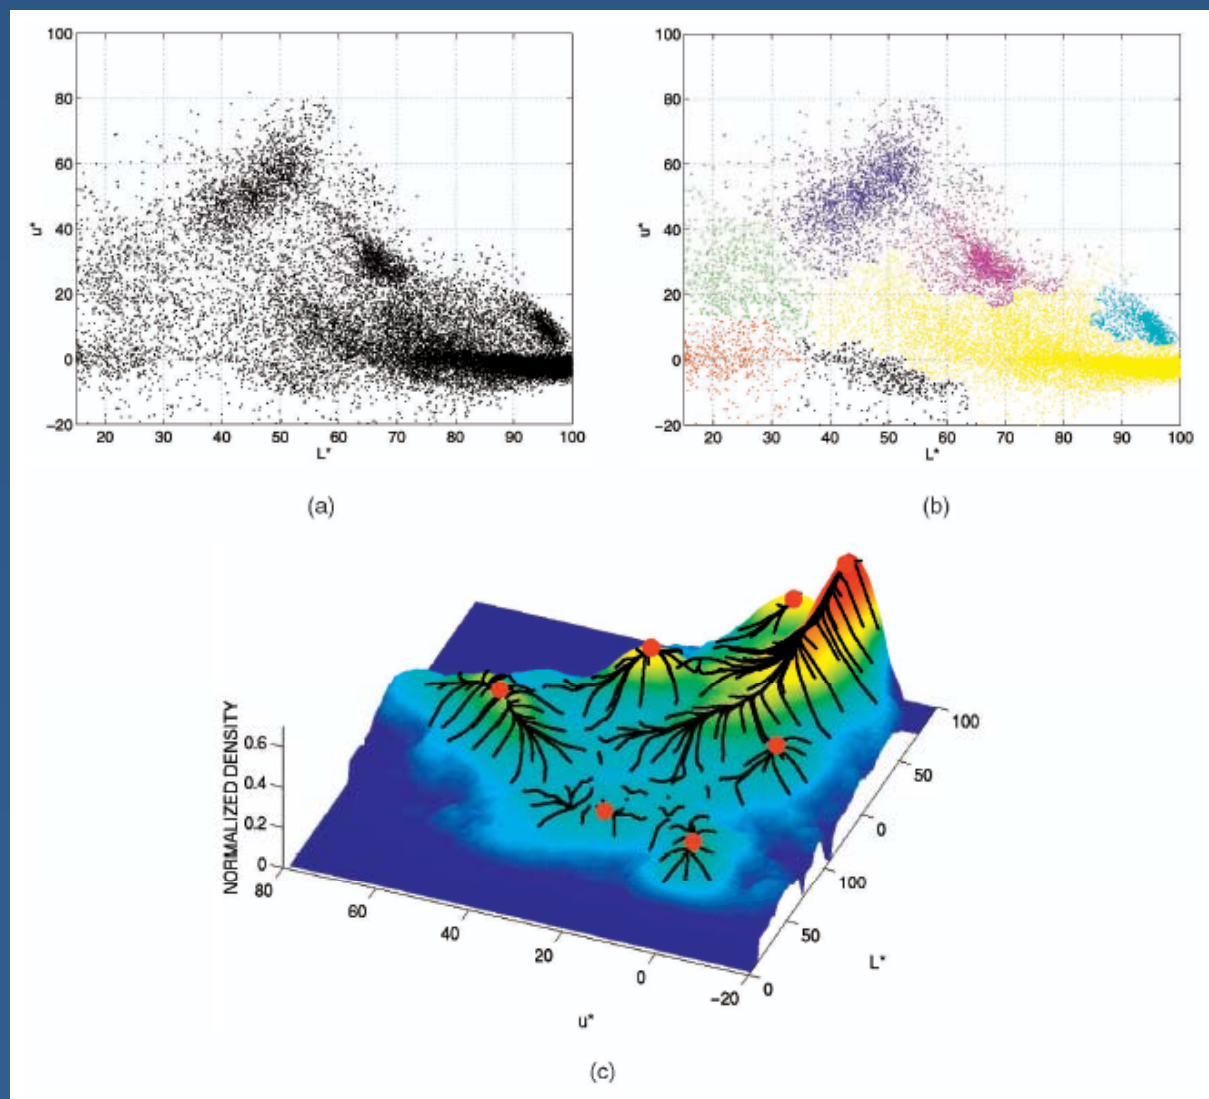

*(courtesy of D. Comaniciu)*

# Mean Shift Algorithm

1. Choose a search window size.
2. Choose the initial location of the search window.
3. Compute the mean location (centroid of the data) in the search window.
4. Center the search window at the mean location computed in Step 3.
5. Repeat Steps 3 and 4 until convergence.

# Mean Shift Results

(courtesy of D. Comaniciu)

# Continuously Adaptive Mean Shift

- A version of the mean shift algorithm can be applied to object tracking based on color
- Start with a object location and an object color profile (hue distribution histogram)

*Video Frame*

*Object Rectangle*

# Continuously Adaptive Mean Shift

- Calculate “backprojection” image: probability that each pixel came from the same hue distribution as the tracked object

- Use Mean Shift Algorithm to find the new object center given its back projection and the initial position of search window

*(courtesy of G. Bradski)*

# CAMSHIFT Example

*(courtesy of Robin Hewitt)*

# Let's Try It Out!

# Summary

- Motion is often much more useful than static image features for understanding what is happening
- There are many tactics for detecting, measuring, and segmenting motion
  - You'll try some out in Assignment #2
  - We'll have more hands-on practice during the next two workshop sessions
- Think about how you might use motion sensing in your project
